

Property hosts IS and HS epithermal gold-silver zones defined by extensive hydrothermal breccia and silica ribs developed on top of porphyry gold-copper style mineralization

- 4,950 ha concession granted on April 4, 2017
- Under-explored area
- SW extension of the highly prospective exploration results obtained at Caña Brava
- Both concessions are strategically located at the junction of a NE oriented belt of epithermal precious metal and related mineralized porphyry prospects and deposits and of a NW-SE oriented belt of intrusive rocks and associated epithermal and porphyry mineralization
